STACK IN DS c program to implement stack

Line Clipping:

It is performed by using the line clipping algorithm. The line clipping algorithms are:

- 1. Cohen Sutherland Line Clipping Algorithm
- 2. Midpoint Subdivision Line Clipping Algorithm
- 3. Liang-Barsky Line Clipping Algorithm

Cohen Sutherland Line Clipping Algorithm:

In the algorithm,	, first of all,	, it is detected	whether line li	es inside th	ne screen	or it is	outside the	screen.	All lines	come	under	any or	e of the
following catego	ries:												

- 1. Visible
- 2. Not Visible
- 3. Clipping Case
- 1. Visible: If a line lies within the window, i.e., both endpoints of the line lies within the window. A line is visible and will be displayed as it is.
- **2. Not Visible:** If a line lies outside the window it will be invisible and rejected. Such lines will not display. If any one of the following inequalities is satisfied, then the line is considered invisible. Let A (x_1,y_2) and B (x_2,y_2) are endpoints of line.

x_{min},x_{max} are coordinates of the window.

 $y_{min'}y_{max}$ are also coordinates of the window.

 $x_1 > x_{max}$

 $x_2 > x_{max}$

y₁>y_{max}

y₂>y_{max}

x₁<x_{min}

 $x_2 < x_{min}$

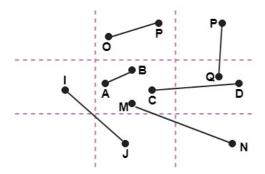

y₁<y_{min}

3. Clipping Case: If the line is neither visible case nor invisible case. It is considered to be clipped case. First of all, the category of a line is found based on nine regions given below. All nine regions are assigned codes. Each code is of 4 bits. If both endpoints of the line have end bits zero, then the line is considered to be visible.

region 1	region 2	region 3		1001	1000	1010	
region 4	region 5	region 6	y max	0001	0000	0010	
region 7	region 8	region 9	y min	0101	0100	0110	
	9 region			X min	X max essigned to 9	regions	

The center area is having the code, 0000, i.e., region 5 is considered a rectangle window.

Following figure show lines of various types

Line AB is the visible case
Line OP is an invisible case
Line PQ is an invisible line
Line IJ are clipping candidates
Line MN are clipping candidate
Line CD are clipping candidate

Advantage of Cohen Sutherland Line Clipping:

- 1. It calculates end-points very quickly and rejects and accepts lines quickly.
- 2. It can clip pictures much large than screen size.

Algorithm of Cohen Sutherland Line Clipping:

Step1:Calculate positions of both endpoints of the line

Step2:Perform OR operation on both of these end-points

 \otimes

Step3:If the OR operation gives 0000

Then

line is considered to be visible

else

Perform AND operation on both endpoints

If And ≠ 0000

then the line is invisible

else

And=0000

Line is considered the clipped case.

Step4:If a line is clipped case, find an intersection with boundaries of the window

$$m = (y_2 - y_1)(x_2 - x_1)$$

(a) If bit 1 is "1" line intersects with left boundary of rectangle window

$$y_3 = y_1 + m(x - X_1)$$

where $X = X_{wmin}$

where X_{wmin} is the minimum value of X co-ordinate of window

(b) If bit 2 is "1" line intersect with right boundary

$$y_3 = y_1 + m(X - X_1)$$

where $X = X_{wmax}$

where X more is maximum value of X co-ordinate of the window

(c) If bit 3 is "1" line intersects with bottom boundary

$$X_3 = X_1 + (y-y_1)/m$$

where $y = y_{wmin}$

y_{wmin} is the minimum value of Y co-ordinate of the window

(d) If bit 4 is "1" line intersects with the top boundary

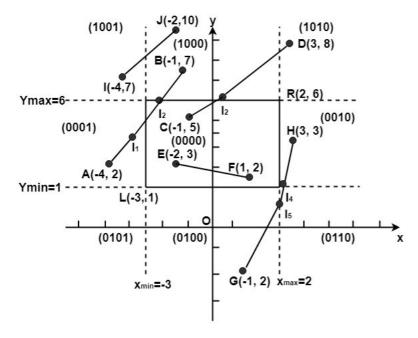

$$X_{3=X}1+(y-y_1)/m$$

where $y = y_{wmax}$

y_{wmax} is the maximum value of Y co-ordinate of the window

Example of Cohen-Sutherland Line Clipping Algorithm:

Let R be the rectangular window whose lower left-hand corner is at L (-3, 1) and upper right-hand corner is at R (2, 6). Find the region codes for the endpoints in fig:

The region code for point (x, y) is set according to the scheme

Bit 1 = sign
$$(y-y_{max})$$
 = sign $(y-6)$

Bit 3 = sign
$$(x-x_{max})$$
 = sign $(x-2)$

Bit 2 = sign
$$(y_{min}-y)$$
=sign(1-y)

Bit 4 = sign
$$(x_{min}-x)$$
=sign $(-3-x)$

Here

```
sign (a) = 1 if a is positive

0 otherwise
```

So

```
A (-4, 2) \rightarrow 0001 F (1, 2) \rightarrow 0000
B (-1, 7) \rightarrow 1000 G (1, -2) \rightarrow 0100
C (-1, 5) \rightarrow 0000 H (3, 3) \rightarrow 0100
D (3, 8) \rightarrow 1010 I (-4, 7) \rightarrow 1001
E (-2, 3) \rightarrow 0000 J (-2, 10) \rightarrow 1000
```

We place the line segments in their appropriate categories by testing the region codes found in the problem.

Category1 (visible): EF since the region code for both endpoints is 0000.

Category2 (not visible): IJ since (1001) AND (1000) = 1000 (which is not 0000).

Category 3 (candidate for clipping): AB since (0001) AND (1000) = 0000, CD since (0000) AND (1010) =0000, and GH. since (0100) AND (0010) =0000.

The candidates for clipping are AB, CD, and GH.

In clipping \overline{AB} , the code for A is 0001. To push the 1 to 0, we clip against the boundary line x_{min} =-3. The resulting intersection point is I_1 (-3,3 $\frac{2}{3}$). We clip (do not display) $\overline{AI_1}$ and I_1 B. The code for I_1 is 1001. The clipping category for I_1 B is 3 since (0000) AND (1000) is (0000). Now B is outside the window (i.e., its code is 1000), so we push the 1 to a 0 by clipping against the line y_{max} =6. The resulting intersection is I_2 (-1 $\frac{3}{5}$,6). Thus I_2 B is clipped. The code for I_2 is 0000. The remaining segment I_1 I_2 is displayed since both endpoints lie in the window (i.e., their codes are 0000).

For clipping \overline{CD} , we start with D since it is outside the window. Its code is 1010. We push the first 1 to a 0 by clipping against the line $y_{max}=6$. The resulting intersection I_3 is ($\frac{3}{5}$, 6),and its code is 0000. Thus $\overline{I_3}$ D is clipped and the remaining segment $\overline{CI_3}$ has both endpoints coded 0000 and so it is displayed.

For clipping \overline{GH} , we can start with either G or H since both are outside the window. The code for G is 0100, and we push the 1 to a 0 by clipping against the line $y_{min}=1$. The resulting intersection point is I_4 (2 $\frac{1}{5}$,1) and its code is 0010. We clip \overline{GI}_4 and work on \overline{I}_4 H. Segment \overline{I}_4 H is not displaying since (0010) AND (0010) =0010.

Program to perform Line Clipping using Cohen Sutherland Algorithm:

```
#include <iostream.h>
#include <conio.h>
#include < graphics.h>
#include <dos.h>
class data
{
  int gd, gmode, x, y, xmin,ymin,ymax,xmax;
  int a1,a2;
  float x1, y1,x2,y2,x3,y3;
  int xs, ys, xe, ye;
  float maxx, maxy;
                                                                                                                                                         \otimes
  public:
     void getdata ();
     void find ();
     void clip ();
     void display (float, float,float,float);
     void checkonof (int);
     void showbit (int);
};
```

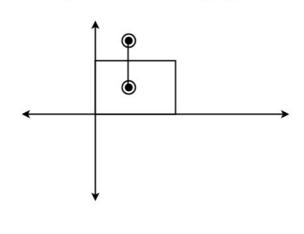

```
void data :: getdata ()
{
  cout < < "Enter the minimum and maximum coordinate of window (x, y) ";
       cin >>xmin>>ymin>>xmax>>ymax;
       cout < < "Enter the end points of the line to be clipped";
       cin >>xs>>ys>>xe>>ye;
       display (xs, ys, xe,ye);
void data :: display (float, xs, float, ys,float xe, float ye)
  int gd=DETECT;
  initgraph (&gd,&gmode, "");
  maxx=getmaxx();
  maxy=getmaxy();
  line (maxx/2,0,maxx/2,maxy);
  line (0, maxy/2, maxx, maxy/2);
  rectangle (maxx/2+xmin,maxy/2-ymax,maxx/2+xmax,maxy/2-ymin);
  line (maxx/2+xs,maxy/2-ys,maxx/2+xe,maxy/2-ye);
  getch();
void data :: find ()
{
  a1=<mark>0</mark>;
  a2=0;
  if ((ys-ymax)>0)
         a1+=8;
  if ((ymin-ys)>0)
     a1 + = 4;
  if ((xs-xmax)>0)
     a1+=2;
       if ((xmin-xs)>0)
     a1+=1;
   if ((ye-ymax)>0)
     a2+=8;
       if ((ymin-ye)>0)
        a2 + = 4;
      if ((xe-xmax)>0)
         a2+=2;
      if ((xmin-xe)>0)
          a2+=1;
     cout < < "\nThe area code of lst point is ";
          showbit (a1);
     getch ();
     cout <<"\nThe area code of 2nd point is ";</pre>
      showbit (a2);
      getch ();
                                                                                                                                                   \otimes
void data :: showbit (int n)
     int i,k, and;
     for (i=3;i>=0;i--)
         and =1 < < i;
```

```
k == 0?cout << "0": cout << "1\"";
      }
}
void data ::clip()
{
      int j=a1&a2;
      if (j==0)
         cout<<"\nLine is perfect candidate for clipping";</pre>
         if (a1 = = 0)
    {
             else
        {
            checkonof(a1);
            x2=x1;y2=y1;
        }
        if (a2=0)
        {
           x3=xe; y3=ye;
       }
       else
       {
            checkonof (a2);
            x3=x1; y3=y1;
        xs=x2; ys=y2;xe=x3;ye=y3;
        cout << endl;
        display (xs,ys,xe,ye);
        cout<<"Line after clipping";</pre>
        getch ()
    else if ((a1==0) && (a2=0))
          cout <<"\n Line is in the visible region";</pre>
          getch ();
    }
void data :: checkonof (int i)
{
    int j, k,l,m;
    1=i&1;
    x1 = 0; y1 = 0;
    if (1==1)
    {
        x1=xmin;
        y1=ys+((x1-xs)/(xe-xs))*(ye-ys);
   }
   j=i&<mark>8</mark>;
  if (j>0)
  {
        y1=ymax;
    x1=xs+(y1-ys)/(ye-ys))*(xe-xs);
  }
  k=i & 4;
```

```
if (k==1)
{
    y1=ymin;
    x1=xs+((y1-ys)/(ye-ys))*(xe-xs);
}
m= i&2;
if (m==1)
{
     x1=xmax;
    y1=ys+ ((x1-xs)/ (xe-xs))*(ye-ys);
 }
 main ()
 {
     data s;
     clrscr();
     s.getdata();
     s.find();
     getch();
     closegraph ();
     return ();
}
```

Output:

The area code of 1st point is 0000 The area code of 2nd point is 1000 Line is perfect candidate for clipping
